# Public Health is Driven by Information

# PUBLIC HEALTH 4.0 – Digital Public Health – Research Challenges

# ALIGNED DIGITAL HEALTH STRATEGY: An European Perspective

## Digital Health and Care

TRANSFORMATION OF HEALTH AND CARE IN THE DIGITAL SINGLE MARKET - Harnessing the potential of data to empower citizens and build a healthier society

### European health challenges

- ⌘ Ageing population and chronic diseases putting pressure on health budgets
- ⌘ Unequal quality and access to healthcare services
- ⌘ Shortage of health professionals

### Potential of digital applications and data to improve health

- ⌘ Efficient and integrated healthcare systems
- ⌘ Personalised health research, diagnosis and treatment
- ⌘ Prevention and citizen-centred health services

### What EU citizens expect...

- 90% agree** To access their own health data (requiring interoperable and quality health data)
- 80% agree** To share their health data (if privacy and security are ensured)
- 80% agree** To provide feedback on quality of treatments

#DigitalSingleMarket #DigitalHealth #eHealth\_EU #EUHealth

### Support European Commission:

#### 1 Secure access and exchange of health data

**Ambition:**  
Citizens securely access their health data and health providers (doctors, pharmacies...) can exchange them across the EU

#### Actions:

- eHealth Digital Service Infrastructure will deliver initial cross-border services (patient summaries and ePrescriptions) and cooperation on between participating countries will be strengthened
- Proposals to extend scope of eHealth cross-border services to additional cases, e.g. full electronic health records
- Recommended exchange format for interoperability of existing electronic health records in Europe

Health Union

#### 2 Health data pooled for research

**Ambition:**  
Shared health data, information, expertise, targeted research, treatment

#### 3

Diagnosis and treatment

## Virtual health care in the era of COVID-19

[Paul Webster](#)

“This is a very big moment for virtual health care. **But, of course, there isn't a lot of readiness.** There are so many ways to monitor people's health that **we aren't doing at any scale**, in large part due to ... regulatory barriers that have meant **we are in no way ready for this moment.**”

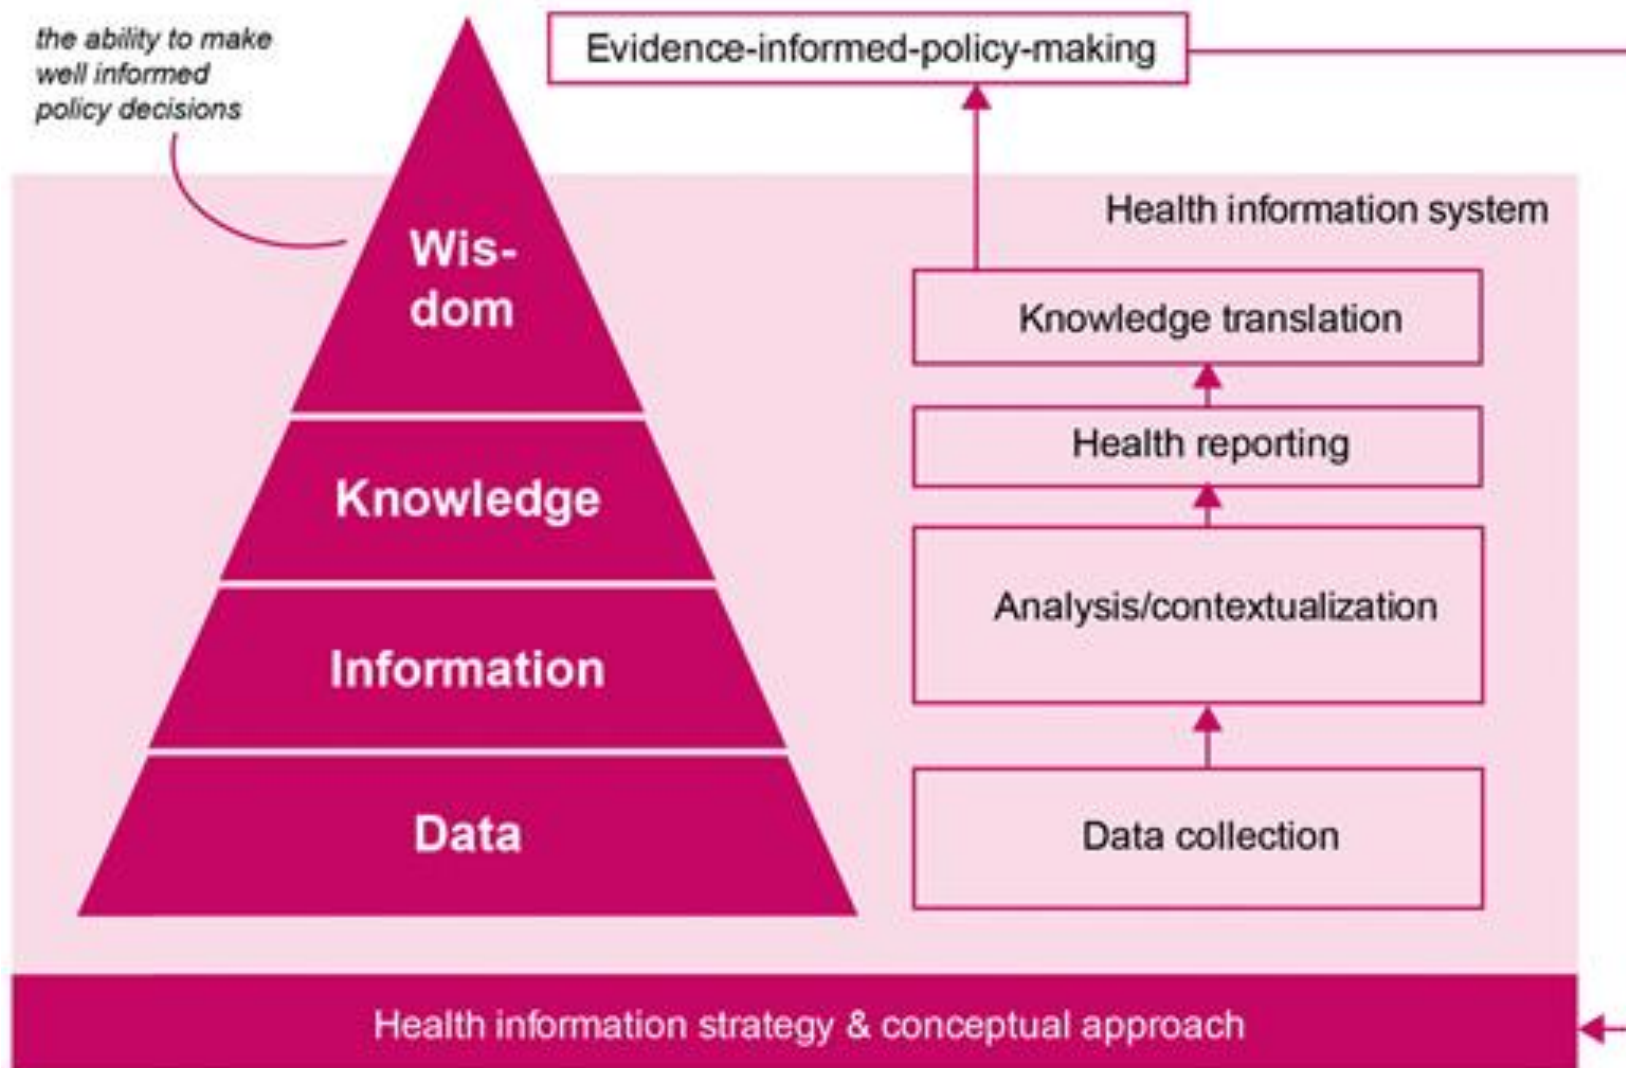

Eric Topol

# IMPROVING PUBLIC HEALTH ONE DRONE AT A TIME

A black drone with four rotors is flying in the sky above a rural village. Below the drone, a large group of people, including children and adults, are gathered in a grassy area. In the background, there are several trees and a small hut with a thatched roof. The sky is blue with scattered white clouds.

"So we asked the population if they would be willing to perform these exams if we take their samples to the nearest primary care centers with drones.

One study is about the **surveillance of flu**, another about **emerging animal infectious diseases** and the last one is about **foodborne illness**.

The sources of information are **Google news, Twitter, and Yelp restaurant reviews**. Machine learning approaches are most often used to detect signals.

**Surveillance is a central topic in public health informatics** with the growing use of machine learning approaches in regards of the size and complexity of data.

# PUBLIC HEALTH SOCIAL NETWORKS OPPORTUNITIES

# Social media interventions for precision public health: promises and risks

Adam G. Dunn<sup>1</sup>, Kenneth D. Mandl<sup>2,3,4</sup> and Enrico Coiera<sup>1</sup>

Social media data can be used with digital phenotyping tools to profile the attitudes, behaviours, and health outcomes of people. While there are a growing number of examples demonstrating the performance of digital phenotyping tools using social media data, little is known about their capacity to support the delivery of targeted and personalised behaviour change interventions to improve health. Similar tools are already used in marketing and politics, using individual profiling to manipulate purchasing and voting behaviours. The coupling of digital phenotyping tools and behaviour change interventions may play a more positive role in preventive medicine to improve health behaviours, but potential risks and unintended consequences may come from embedding behavioural interventions in social spaces.

## INTRODUCTION

In 2013, a series of new methods were published demonstrating the possibility of using Facebook 'likes' to predict aspects of personality and demographics.<sup>1–3</sup> These experiments showed the ease with which individuals can be profiled using the digital traces they leave behind online, and generated interest among academics as well as commercial and political organisations. Then in 2017, we saw experimental evidence that these tools can be wielded for the purposes of social manipulation,<sup>4</sup> as well as evidence that tools based on these methods were being deployed at unprecedented scales to manipulate voting in elections.<sup>5</sup> News about the way Cambridge Analytica accessed and used Facebook data remind us not only that our personal data can be leveraged to influence our behaviour, but also that the regulatory and ethical frameworks around those activities are underdeveloped.

or health outcomes, but the ways they are operationalised to change health behaviours are different.

Population-level studies that aggregate publicly-accessible data have demonstrated the capacity to model spatial variations in voting behaviours,<sup>10</sup> cardiovascular mortality,<sup>11</sup> and vaccine coverage.<sup>12</sup> Studies tend to use Twitter when larger volumes of data are required.<sup>13</sup> These types of studies are validated against traditional data sources including surveys, disease notifications, and census data. In most cases, data from social media platforms produce a biased representation of location or demography.<sup>14,15</sup> Accounting for biases in data are important in studies that conclude about incidence and prevalence without validating models against other data sources (especially social media studies that draw conclusions based on number of tweets).<sup>16</sup> Because studies examining associations between what can be observed on social media and health outcomes have, so far, been limited to

# Effective uses of social media in public health and medicine: a systematic review of systematic reviews

## Need to measure the effectiveness of social technologies

### Abstract

**Introduction:** Research examining the effective uses of social media (SM) in public health and medicine, especially in the form of systematic reviews (SRs), has grown considerably in the past decade. To our knowledge, no comprehensive synthesis of this literature has been conducted to date.

**Aims and methods:** To conduct a systematic review of systematic reviews of the benefits and harms ("effects") of SM tools and platforms (such as Twitter and Facebook) in public health and medicine. To perform a synthesis of this literature and create a 'living systematic review'.

**Results:** Forty-two (42) high-quality SRs were examined. Overall, evidence of SM's effectiveness in public health and medicine was judged to be minimal. However, qualitative benefits for patients are seen in improved psychosocial support and psychological functioning. Health professionals benefited from better peer-to-peer communication and lifelong learning. Harms on all groups include the impact of SM on mental health, privacy, confidentiality and information reliability.

**Conclusions:** A range of negatives and positives of SM in public health and medicine are seen in the SR literature but definitive conclusions cannot be made at this time. Clearly better research designs are needed to measure the effectiveness of social technologies. For ongoing updates, see the wiki "Effective uses of social media in health: a living systematic review of systematic reviews".

## #8 Ice Bucket Challenge: ALS Association

The ALS Association 'Ice Bucket Challenge' social media campaign raised over \$115 million in August 2014 for ALS research.

It started when three men living with ALS posted a video of themselves dumping buckets of ice water on themselves. Then they each called out one person to perform the same challenge. Before they knew it, 17 million people had uploaded their videos to social media over a span of one month. Over 400 million people watched these videos 10 billion times.

# PHIRI – POPULATION HEALTH INFORMATION RESEARCH INFRASTRUCTURE

PHIRI will lay the foundation to build a **Distributed Infrastructure on Population Health (DIPoH)**

HOME ABOUT US ▾ WORK PACKAGES ▾ GLOSSARY

## The PHIRI project

Welcome to the official webpage of PHIRI, *the Population Health Information Research Infrastructure*.

PHIRI is the implementation of the **research infrastructure on population health** to provide the best available evidence for research on health and well-being of populations and to support better coordinated European efforts across national and European stakeholders to share and reuse health knowledge. In doing so, PHIRI will lay the foundation to build a **Distributed Infrastructure on Population Health (DIPoH)** to be used to overcome future crisis and ensuring the sustainability of health data across Europe through the identification, access, assessment and reuse of population health data to underpin public health policy decisions. This will be achieved through a close collaboration with European countries over a period of 36 months starting in November 2020. The project is divided in 9 ambitious work packages with three transversal topics. PHIRI builds on the achievements of the [BRIDGE Health](#) and the [Joint Action on Health Information \(InfAct\)](#) projects.
